Review on “Demersal assemblages on the soft bottoms off the Catalan-Levante coast of the Spanish Mediterranean” by Garcia-Rodriguez et al., 2011. Journal of Marine Biology.
doi:10.1155/2011/976396

My opinion

This paper is interesting. It describes the fish communities off the western Mediterranean Sea and how they assemblage according the different bathymetric strata. In my view this research is useful both to the scientific community and the society, as it provides knowledge for a better management of marine resources. Every fish assemblage and habitat may need different management measures for a proper use and conservation. This paper describes the content of every ecosystem, providing also maps on where those fish ecosystem are located.

Best regards
